

How to install the sensor for APL Smart and Safety Cross

The sensor is dedicated to the detection of pedestrians close to the pedestrian crossings.
Follow carefully the instructions below:

- Mounting height: **3~3,5 m**
- Sensor placement:
the offset distance from the axis of the crossing must be from **2 m to 2,5 m** anticipating the pedestrian crossing from the driver's point of view.
- The sensor should be positioned as close as possible to the crossing to create a **"detection area"** parallel to pedestrian crossing stripes in order to avoid the creation of blind spots or the activation of the system by vehicles.

How not to install the sensor
